IT3060– Human Computer Interaction   **Semester 2 2023**

You must do these activities in groups as set by the coordinators.

Activity 1:

Find usability issues of your selected website.

Previous week **each individual student** selected a website with usability issues. Now, you need to write down 10 usability issues in that selected website and how you can improve it using HCI concepts.

Activity 2:

Think about the Scope and the workload and check each member whether your selected website can achieve it.

Scope/workload: Each group member needs to work on 3 interfaces with 1 CRUD operation. (i.e. 5 members in the group, 15 interfaces in the project and 4 CRUD operations)

Activity 3:

Explain your website to your group members and finalize a website.

Each member can discuss within the group and check the scope and workload and decide the final software application to continue in this module. Group leader needs to get the responsibility to finalize the project and divide the workload.

NOTE: If you have any queries regarding the Software application selection you can discuss with the instructors and get a feedback.
